Finding Common Ratios. The yearly salary values described form a geometric sequence because they change by a constant factor each year. Each term of a geometric sequence increases or decreases by a constant factor called the common ratio. The sequence below is an example of a geometric sequence because each term increases by a constant factor of 6.

Test for an arithmetic sequence. To test whether a sequence is an arithmetic sequence or not, check if the difference between any two consecutive terms is constant:  $d = T_2 - T_1 = T_3 - T_2 = \dots = T_n - T_{n-1}$  If this is not true, then the sequence is not an arithmetic sequence. Worked example 1: Arithmetic sequence

In an arithmetic sequence, the difference between a term and its immediately preceding term is always same. Let use see here, #2-1=1# #4-2=2# #7-4=3# #11-7=4# Here the difference is continuously increasing. Hence, it is not an arithmetic sequence. Note: In an geometric sequence, the ratio of a term to its immediately preceding term is always same.

About "Competitive Mathematics for Gifted Students" This series provides practice materials and short theory reminders for students who aim to excel at problem solving. Material is introduced in a structured manner: each new concept is followed by a problem set that explores the content in detail. Each book ends with a problem set that reviews both concepts presented in the current volume and related topics from previous volumes. The series forms a learning continuum that explores strategies specific to competitive mathematics in depth and breadth. Full solutions explain both reasoning and execution. Often, several solutions are contrasted. The problem selection emphasizes comprehension, critical thinking, observation, and avoiding repetitive and mechanical procedures. Ready to participate in a math competition such as AMC-8, AMC-10, Math Kangaroo in USA, Math Leagues, USAMTS, or AIME? This series will open the doors to consistent performance. About Level 3 This level of the series is designed for students who can solve linear equations, are fluent with fractions, and can factor into primes. The problem sets are designed to strengthen specific areas where we know students have difficulty on AMC-8 and AMC-10. The level 3 books are a strong preparation for AMC-8 and a partial preparation for AMC-10 and AIME. Level 3 consists of: Word Problems (volume 9), Arithmetic and Number Theory (volume 10), Operations and Algebra (volume 11), Geometry (volume 12), and Combinatorics (volume 13). On the contest list for this level: MATHCOUNTS, Math Kangaroo levels 5-6 and 7-8, MOEMS-M, Purple Comet, AMC-8, AMC-10. Their complexity makes these problem sets useful for preparing the AIME in the long run. About Volume 12 - Geometry This workbook is targeted at students who have not yet taken a standard geometry course. We explore a number of contest topics from an intuitive, hands-on perspective. The topics included are competition specific.
