The copy of Principles of Mathematical Analysis by Walter Rudin that I own is interesting in one way; it states that it is the Indian Edition. Now I don ' t know much about publishing, but the biggest issue for me was whether or not the book was in English since I don ' t know any Indian languages. I mean, I suppose the paper making up the book ...

**Principles of Mathematical Analysis by Walter Rudin**

Mathematical Modeling essentially consists of translating real world problem into mathematical problem, solving the mathematical problems and interpreting these solutions in the language of real world. Nevertheless, a real world problem, in all its generality can seldom be translated into a mathematical problem, still it works. For example, a ball is the concept of a sphere.

Mathematical concepts – context is keyMathematical concepts – context is key. In the typical mathematics classroom, especially in the middle years of schooling, we tend to use one model to connect maths with the real world; we start by teaching the maths content and skills, we then get students to practice and do some maths, and then we next might apply some of those skills into a real world context by using learning activities such as word problems.

We begin this book with a dictionary definition of the wordmodel: model(n): a miniature representation of something; a pattern of some- thing to be made; an example for imitation or emulation; a description or analogy used to help visualize something (e.g., an atom) that cannot be dir- ectly observed; a system of postulates, data and inferences presented as a mathematical description of an entity or state of affairs.

**What is Mathematical Modeling?**

1st year mathematics is heavily focused on grounding the student in mathematical analysis. Sequences, series, limits, sums, continuity and differentiability are the bread & butter concepts every maths student needs to know inside out. They call this task, 'the leap from school maths into university maths'.
