Core logging procedure The following steps are suggested during the core logging process: Clean the core of drilling fluids or mud. Mark major structures, proposed point load testing locations, and depths (every 1-2 metres) on undisturbed core in splits.

design. Geotechnical core logging is usually a very detail-oriented, slow, and rather tedious process that requires long periods of attention from the personnel doing the logging.

Geotechnical Core Logging | RockEng

?Basic logging is conducted for every run.
?The drilling run is considered to be the length of rod that was drilled into the ground before recovering the core inner-tube.
?At the end of every drilling run, the driller brings the core inner- tube to the surface to empty. A "full" drilling run

A geotechnical core logging process has been developed to record mechanical and structural properties of the rock mass. The method enables data for a wide range of rock properties and geotechnically significant major structures to be collected including rock strength, joint surface condition, fracture frequency and fracture orientation.

A guide for the logging of borehole core for rock engineering purposes is proposed. General acceptance of such a guide ensures that core logs will generally contain meaningful descriptions of the rock mass parameters most significant in rock engineering problems.
