Fig. 9.3 shows the input-output characteristics of a typical op amp. When the differential input voltage ($V_+ - V_-$) is in the range where the slope = A_o , the output v_o is equal to $A_o (V_+ - V_-)$; otherwise the output is saturated at $\pm V_{sat}$. The "trick" in designing linear op amp circuits is to use of negative feedback to always force ($V_+ - V_-$) to be suf -

loading effect at the output port of an ideal op-amp: $V_o = A \times V_i$ (8) Finally, because $A = \infty$ and V_o must be finite, $V_i = V_p - V_n = 0$, or $V_p = V_n$ (9) Note: Although Equations 3-5 constitute the ideal op-amp assumptions, Equations 6 and 9 are used most often in solving op-amp circuits. $V_{in} = R_1 V_{out} + \dots$ $V_p = V_n$ $V_{in} = V_{out} + \dots$ V_p

Op-Amps Experiment Theory

Op-Amp Circuits Purpose: In this experiment, you will learn about operational amplifiers (or op-amps). Simple circuits containing operational amplifiers can be used to perform mathematical operations, such as addition, subtraction, and multiplication, on signals. They can also be used to take derivatives and integrals.

amp is thought of as an Ideal Op Amp. The Ideal Op Amp has a few basic rules that apply. These rules are as follows: 1. Infinite voltage gain 2. Infinite input impedance 3. Zero output impedance 4. Infinite bandwidth Unfortunately there is no such device, and there are limits to the parameters of a real op amp. There are two rules of which an op amp will follow, too.

When the output voltage exceeds the supplied power, the op amp saturates.

The best way to study the AC characteristic response curve of an op amp is to measure its Bode plot. The Bode plot is basically a plot of gain (dB) and phase (degrees) as a function of log frequency. The transfer function for an inverting op amp circuit is given by: $V_{out} = - (R_f/R_1) V_1$

Where, A_{OL} = open-loop gain of op-amp.
 Z_i = input impedance of op-amp without any feedback. β = feedback factor. For a non-inverting amplifier, the feedback factor is given as. $\beta = R_2 / (R_1 + R_2) = 1/A_{CL}$. Therefore, for a non-inverting amplifier circuit, the input impedance is given by the equation, $Z_{IN} = \{1 + (A_{OL} / A_{CL})\} Z_i$
