A controller is a system where one or more input quantities are recorded and processed internally by the system, thereby affecting various output quantities. Signals such as switching states are entered via control inputs, processed in the controller by a program and forwarded to outputs to be switched.

Programmable Logic Controllers Beginner's Manual

A programmable logic controller or programmable controller is an industrial digital computer which has been ruggedized and adapted for the control of manufacturing processes, such as assembly lines, or robotic devices, or any activity that requires high reliability, ease of programming and process fault diagnosis. PLCs can range from small modular devices with tens of inputs and outputs, in a housing integral with the processor, to large rack-mounted modular devices with a count of thousands of
