One of the promising candidates is the all-solid-state battery with inorganic solid ion conductors. By replacing the currently employed liquid electrolyte, this battery architecture is thought to pave the way for a significant enhancement in the energy density with a Li-metal anode, as well as increase the battery safety [1-4]. The superior thermal stability of solid electrolytes enables operation without cooling, leading to a further gain in energy density when it comes to the device ...

Composite interface – Graphite/SE interface. Solid-state batteries with two kinds of lithium solid electrolytes showed good characteristics for the graphite electrode. The electrolyte is a combination of Li-Li₂S-P₂S₅ glass contacted with the negative electrode material and Li₃PO₄-Li₂S-SiS₂ glass or Li₂S-GeS₂-P₂S₅ crystalline material contacted with the positive electrode.
